

Air Quality Report

Appendix I to the 1998 Annual Report

**Arizona Department of
Environmental Quality**

ADEQ 1998 Annual Report List

The Arizona Department of Environmental Quality *1998 Annual Report* and its five appendices comprise the agency submittal to the Arizona State Legislature and the Governor's Office. The volume entitled *1998 Annual Report* is designed to serve the needs of our diverse customers by presenting an overview of the department's 1998 fiscal year activities. A list of all of the 1998 annual report documents is shown below. Statutory references for mandated reports are shown in parentheses where appropriate.

1998 Annual Report (A.R.S.§ 49-104.A.6)

Air Quality Report (A.R.S.§ 49-424.10), *Appendix I*

Recycling Report (A.R.S.§ 49-832.C), Waste Programs Division, *Appendix II*

Waste Programs Report, *Appendix III*

Underground Storage Tank Assurance Fund Report (A.R.S.§ 49-1051.D)

Waste Tire Report (A.R.S.§ 44-1306.B)

WQARF Report (A.R.S.§ 49-282.G)

Pollution Prevention Report (A.R.S.§ 49-966)

Hazardous Waste Inspections and Enforcement Report (A.R.S.§ 49-105)

Groundwater Quality Report (A.R.S.§ 49-225.D), Water Quality Division, *Appendix IV*

Water Quality Report, *Appendix V*

Safe Drinking Water Report (A.R.S.§ 49-105)

Water Quality Enforcement Report (A.R.S.§ 49-105)

Aquifer Protection Permit Fee Schedule (A.R.S.§ 49-241.E)

Aquifer Protection Permit Priority List (A.R.S.§ 49-241.D)

Aquifer Protection Application Status (A.R.S.§ 49-241.E)

1997 Pesticide Annual Report (A.R.S.§ 49-303.B)

You may obtain a free copy of the *1998 Annual Report* by picking it up from ADEQ's Information Desk at 3033 North Central Avenue, Phoenix, Arizona. You may also call (602) 207-2202 or in Arizona, 1-800-234-5677, extension 2202, to request a copy. If you are interested in purchasing one or more of the appendices, please call the number above for pricing information and ordering assistance.

Air Quality Report (A.R.S. § 49-424.10), Appendix I

The ADEQ Air Quality Monitoring Program tracks the quality of ambient air through a statewide network of monitoring sites. Using data collected at the monitoring sites, air quality control measures are developed and implemented to bring nonattainment areas into compliance with federal and state air quality standards.

This report contains information regarding the health and welfare effects of air pollutants. It also summarizes air quality standards, describes Arizona's air quality monitoring network, and provides 1997 air quality data summaries and air quality trends.

According to the report, carbon monoxide air quality in the Phoenix metropolitan area improved substantially since 1987. As a result, compliance with federal and state standards was achieved in the last three years. Ozone air quality in the Phoenix metropolitan area also improved, but only in the past two years, 1996 and 1997. PM₁₀ air quality improvements in the rural and industrial areas of Arizona continued. Consequently, attainment of air quality standards was demonstrated in Ajo, Bullhead City, Douglas, Nogales, Paul Spur, Payson, Rillito, and Yuma. However, PM₁₀ standard exceedances persist in Maricopa and Pinal counties.

Sulfur dioxide air quality in three copper smelters towns, Hayden, Miami, and San Manuel continued to be excellent since 1990 when compliance with air quality standards was achieved.

I. AIR QUALITY STANDARDS

EPA has set National Ambient Air Quality Standards (NAAQS) for seven pollutants, which are summarized in Table 1. For each pollutant EPA has adopted primary standards to protect public health and secondary standards to protect public welfare. States are required to adopt standards which are at least as stringent as NAAQS. In Arizona, ambient air quality standards are identical to the federal NAAQS. These seven pollutants are referred to as criteria pollutants because criteria documents are prepared which summarize effects on public health and welfare.

A brief summary of the health and welfare effects which have been considered prior to setting ambient air quality standards is given below. It should be noted that PM_{2.5} and PM₁₀ are defined as particles equal to or less than 2.5 and 10 microns in diameter, respectively.

Pollutant

Carbon monoxide	Impairs the ability of blood to carry oxygen in the body. Cardiovascular system is primarily affected, causing angina pain in persons suffering from cardiac disease and leg pain in persons suffering from cardiac arterial disease. Affects other mammals in a similar manner.
Lead	Damages the cardiovascular, renal, and nervous systems resulting in anemia, brain damage, and kidney disease. Preschool-age children are particularly susceptible to brain damage effects. Similar effects observed in other mammals. Other adverse effects on animals, microorganisms, and plants.
Nitrogen dioxide	Impairs the respiratory system, causing a high incidence of acute respiratory diseases. Preschool-age children are especially at risk. Damages certain plants and materials. Degrades visibility due to its brownish color and its conversion to nitrate particles. Nitrate particles are also a major component of acid deposition.
Ozone	Damages the respiratory system, reducing breathing capacity and causing chest pain, headache, nasal congestion and sore throat. Individuals with chronic respiratory diseases are especially susceptible to ozone. Injures certain plants, trees, and materials.
PM _{2.5} /PM ₁₀	Causes irritation and damage to the respiratory systems, resulting in difficult breathing, induction of bronchitis, and aggravation of existing respiratory diseases. Also, certain polycyclic aromatic hydrocarbons in PM _{2.5} /PM ₁₀ are carcinogenic. Individuals with respiratory and cardiovascular diseases, children, and elderly persons are at greatest risk. Secondary effects include soiling, damaging materials and impairment of visibility. Sulfates and nitrates in PM _{2.5} /PM ₁₀ are responsible for acid deposition which damages materials, plants, and trees and acidifies surface waters, thereby harming aquatic life.

Sulfur dioxide Aggravates asthma, resulting in wheezing, shortness of breath, and coughing. Healthy persons exhibit the same responses at higher exposures. Asthmatics and atopic individuals are the most sensitive groups, followed by those suffering from bronchitis, emphysema, bronchiectasis, cardiovascular disease, and the elderly, and children. Damages certain plants and materials. Causes visibility impairment and acid deposition due to its conversion to sulfate particles.

The Clean Air Act requires EPA to periodically review the NAAQS and adopt revisions when new information indicates that changes are required. As a result, EPA revised the ozone standard in July 1997 from a 1-hour standard of 0.12 ppm to an 8-hour standard of 0.08 ppm, based on information indicating that the chronic effects of ozone correlate better with 8-hour exposures than with 1-hour exposures. EPA also changed the procedure for determining compliance with the standards. The new procedure requires determining the fourth highest 8-hour concentration for each year for three consecutive years. These three values are then averaged to determine the average fourth highest value for the 3-year period. This value must be 0.084 ppm or less to indicate compliance (values are rounded to the nearest 0.01 ppm).

In regard to PM₁₀, EPA made one minor change to the standards by modifying the procedure for determining compliance with the 24-hour standard. The new procedure requires determining the 99th percentile value for each year for three consecutive years. These three values are then averaged to determine the average 99th percentile for the 3-year period. This value must be 154 ug/m³ or less to indicate compliance (values are rounded to the nearest 10 ug/m³). For PM_{2.5} EPA set standards of 65 ug/m³ for a 24-hour averaging time and 15 ug/m³ for an annual period. Compliance is determined in a similar manner as for the PM₁₀ standards. The only exception is the use of the 98th percentile to determine compliance with the 24-hour PM_{2.5} standard.

Table 1
Summary of Ambient Air Quality Standards
State and Federal Standards

Pollutant	Averaging Time	Primary	Secondary
Carbon Monoxide	1-hr 8-hr	35 ppm 9 ppm	None
Nitrogen Dioxide	Annual	100 ug/m ³	100 ug/m ³
Ozone ^a	1-hr 8-hr	0.12 ppm 0.08 ppm	0.12 ppm 0.12 ppm
PM _{2.5} ^b	24-hr Annual	65 ug/m ³ 15 ug/m ³	65 ug/m ³ 15 ug/m ³
PM ₁₀	24-hr Annual	150 ug/m ³ 50 ug/m ³	150 ug/m ³ 50 ug/m ³
Sulfur Dioxide	3-hr 24-hr Annual	--- --- 365 ug/m ³ state 0.14 ppm federal 80 ug/m ³ state 0.03 ppm federal	1300 ug/m ³ state 0.5 ppm federal --- --- ---
Lead	Calendar Qtr.	1.5 ug/m ³	1.5 ug/m ³

Summary of Emergency Episode Levels
State and Federal

Pollutant	Averaging Time	Alert	Warning	Emergency	Significant Harm
Carbon Monoxide	1-hr 4-hr 8-hr	--- --- 15 ppm	--- --- 30 ppm	--- --- 40 ppm	125 ppm 75 ppm 50 ppm
Nitrogen Dioxide	1-hr 24-hr	0.60 ppm 0.15 ppm	1.20 ppm 0.30 ppm	1.60 ppm 0.40 ppm	2.00 ppm 0.50 ppm
Ozone	1-hr	0.20 ppm	0.40 ppm	0.50 ppm	0.60 ppm
PM ₁₀	24-hr	350 ug/m ³	420 ug/m ³	500 ug/m ³	600 ug/m ³
Sulfur Dioxide	24-hr	0.30 ppm	0.60 ppm	0.80 ppm	1.00 ppm

- a. In July 1997 the standard was revised from 0.12 ppm for a 1-hour average to 0.08 ppm for an 8-hr average.
- b. In July 1997 the EPA adopted standards for PM_{2.5}.

II. AIR QUALITY MONITORING NETWORKS

A. MONITORING NETWORKS

In Arizona, ambient air monitoring for criteria pollutants is conducted by a number of governmental agencies, and regulated industries. Criteria pollutants are those pollutants for which federal and state air quality standards have been adopted. They include carbon monoxide, lead, nitrogen dioxide, ozone, PM₁₀, PM_{2.5}, and sulfur dioxide. Federal and state air quality standards for these pollutants are listed in Table 1. A list of the monitoring network operators and the areas monitored is given below.

<u>Agency or Industry</u>	<u>Area Monitored</u>
Arizona Portland Cement Co.	Rillito
Arizona Public Service Co.	Joseph City
ASARCO, Inc.	Hayden
BHP Copper, Inc..	San Manuel
Cyprus Miami Mining Corp.	Miami
Maricopa County Environmental Services Dept.	Phoenix Urban Area
National Park Service	National Monuments and Parks
Pima County Dept. of Environmental Quality	Tucson Urban Area
Pinal County Air Quality Control District	Pinal County
Praxair, Inc.	Kingman
Salt River Project	Page and St. Johns
Southern California Edison Co.	Bullhead City, AZ and Laughlin, NV
Tucson Electric Power Co.	Tucson and Springerville

Maps indicating the locations of the Phoenix, Tucson and statewide monitoring stations are provided in Figures 1, 2, and 3. The Maricopa, Pima, and Pinal Counties networks are operated primarily to monitor urban-related air pollution. In contrast, the industrial networks are operated to monitor emissions from certain industrial facilities. State monitors are employed for a variety of purposes, including urban, industrial, rural and background surveillance.

B. DATA REPORTING/QUALITY ASSURANCE

Ambient air quality data collected in 1997 by the various networks above are summarized in Section II of this report. In addition, Maricopa and Pima counties and some companies publish annual reports which include summaries of their data.

Raw data files are maintained by each of the network operators. In addition, the EPA stores raw data submitted quarterly by Maricopa and Pima counties and the state. EPA analyzes these data to evaluate progress in attaining and maintaining NAAQS and reporting trends in air quality to the president and Congress.

Maricopa and Pima counties report pollutant concentrations in the Phoenix and Tucson urban areas each day to the public via television, radio, newspapers and telephone. The data are reported in pollutant standard index (PSI) units, that is, units of concentrations relative to the standards. These reports include the descriptor words "good," "moderate," "unhealthy," "very unhealthy," or "hazardous," depending on pollutant levels.

Industrial operators submit either monthly or quarterly data reports to the state, depending on the type of facility. In addition, they are required to report any exceedance of an air quality standard by the next working day. The report includes an explanation of the causes of the exceedance and corrective actions to be taken, if possible, to prevent future occurrences.

To ensure that valid data are obtained, each network operator conducts a quality assurance program in accordance with state and federal requirements.

C. SPECIAL MONITORING STUDIES

In addition to monitoring criteria pollutants at fixed sites, the state conducts special monitoring studies. These studies address several issues including:

- Visibility in urban areas.
- Visibility in Class I (pristine) areas.
- Hazardous Air Pollutants (HAPS),
- Border-area air quality, and
- Volatile organic compounds (ozone nonattainment plans).

Visibility is monitored in the urban areas of Phoenix and Tucson to assess spatial and temporal variations and to evaluate sources of visibility reduction. This study is a follow-up to the research performed by DRI (Desert Research Institute) in Phoenix in 1989-1990 and by ENSR Consulting and Engineering in Tucson in 1992-1993, the so-called brown cloud studies. In these studies DRI and ENSR

performed special monitoring to determine which pollutants have the greatest impact on visibility. They also determined the major sources of these pollutants. However, since this research was performed in the fall and winter seasons, it is necessary to conduct year-round monitoring to assess seasonal changes in visibility.

Visibility is also monitored in federally designated Class I areas, which are pristine places where visibility protection is required by the Clean Air Act. There are 12 Class I areas in Arizona which are managed either by the National Park Service or the U.S. Forest Service. Through the IMPROVE (Interagency Monitoring of Protected Visual Environments) Program, visibility information has been collected at a few of the Class I areas over the course of the last 12 or so years. In order to more fully understand visual air quality in all Class I areas in Arizona, the state has taken the lead in a cooperative program with the Park Service and the Forest Service in expanding the number of monitoring locations. The program is presently being implemented, and seven sites were operational by June, 1998. These are at Saguaro National Monument at Mt. Ord for the Mazatzal Wilderness, at Humboldt Peak for the Pine Mtn. Wilderness, at Muleshoe Ranch for Galiuro Wilderness, at Rucker Canyon for Chiricahua Wilderness, at McFadden Peak for Sierra Ancha Wilderness, and at Sycamore Canyon Wilderness. Later in 1998, monitoring equipment will be in place at Green's Peak for Mt. Baldy Wilderness.

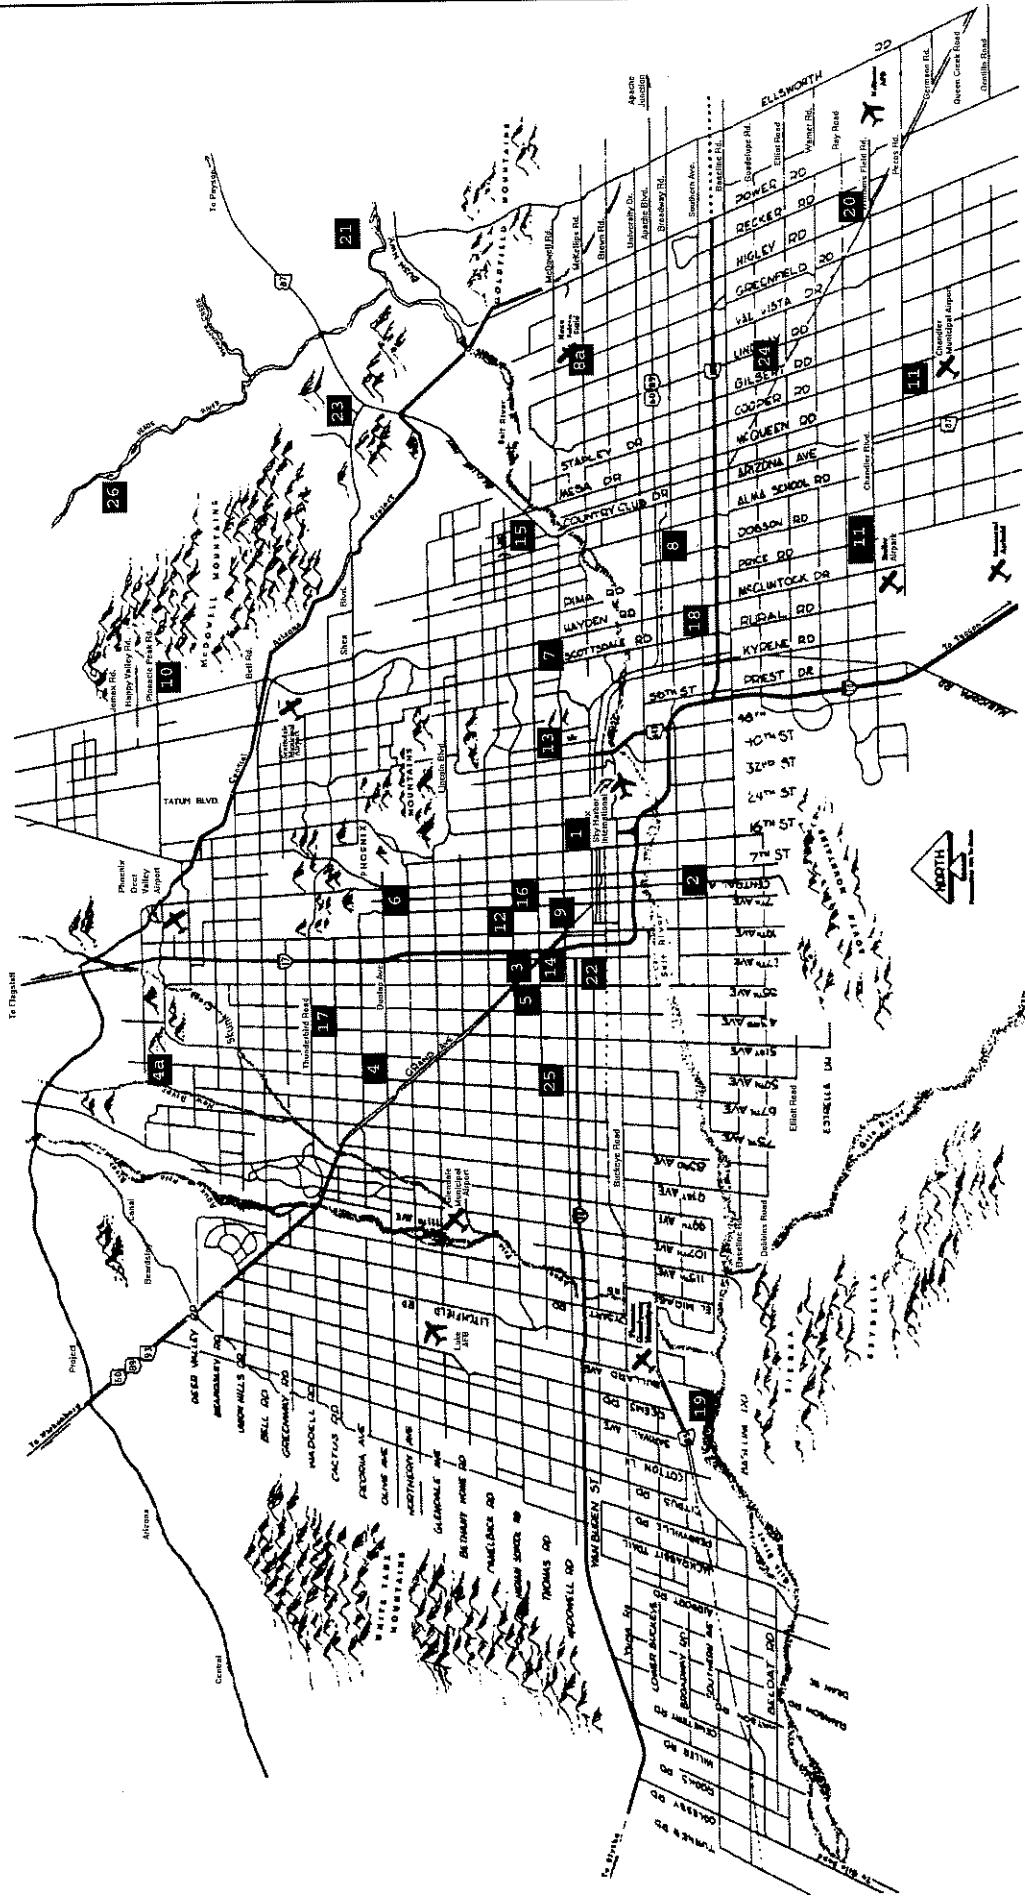

HAPS monitoring was initiated in 1993 by the state in conjunction with a study of the impacts of HAPS in Arizona. In addition to monitoring, the study involved an inventory of sources and emissions and an assessment of health risks due to HAPS. This project was completed and a report was submitted to the Legislature in 1995.

On the Arizona-Mexico border special monitoring studies are conducted to evaluate the air quality impacts of urban and industrial activities. Preliminary studies conducted in 1990 found that a majority of PM₁₀ pollution measured on the U.S. side of the border originated in Mexico and was transported by winds which cause air pollution exchange between the two countries. Starting in 1994, a second study in the Nogales area was done. In this study, monitoring for PM₁₀ and HAPS was performed in both Nogales, Mexico and Nogales, Arizona. An inventory of PM₁₀ and HAPS emissions on both sides of the border was completed in July 1997; the results will be used in air quality modeling studies for human health risk assessment, to apportion source impacts, and for evaluation of potential controls. In the summer of 1998, a similar PM₁₀/HAPS monitoring and emissions inventory investigation will be initiated in the Douglas-Agua Prieta area.

In the Phoenix metropolitan area, enhanced monitoring of ozone, its photochemical precursors, and meteorology is planned for 1999. This monitoring is required because of the recent reclassification of this area serious for ozone nonattainment planning purposes, based on ozone concentrations monitored in recent years. Federal legislation and regulations call for the establishment of "Photochemical Assessment Monitoring Stations" (PAMS) in ozone nonattainment areas classified as serious, severe, or extreme. ADEQ will be responsible for as many as five PAMS, and is determining the most cost-effective and technically sound method to meet the enhanced monitoring requirement. This program will evolve as the PAMS program continues to be implemented over the next few years. A PAMS network description, or an approved alternative network description, including a schedule for implementation, will be submitted to EPA in the near future.

PM_{2.5} monitoring is scheduled to begin in November 1998 throughout Arizona as a result of EPA adopting PM_{2.5} standards in 1997. Planning for this monitoring program has been accomplished through a cooperative effort by ADEQ, Maricopa, Pima, and Pinal Counties, Pima Association of Governments and EPA. Samplers will operate in the major metropolitan areas of Phoenix and Tucson, and in other areas of the state to determine compliance with PM_{2.5} standards. PM_{2.5} samplers will also be operated at remote sites to monitor the transport of PM_{2.5} from urban areas to pristine Class I areas where visibility protection is a major concern. In addition, sampling will be conducted at remote sites to measure background concentrations of PM_{2.5} in various regions of Arizona. A centralized laboratory for the distribution of filters and gravimetric analysis of PM_{2.5} samples will be established at ADEQ. For data management purposes, ADEQ will establish a database to track filter processing, to record field, laboratory, and QA/QC data, and to prepare reports.

III. AIR QUALITY DATA FOR 1997

Table 2 lists the counties and towns monitored in the state and the pollutants for which data are listed.

The 1997 data summaries, which are tabulated in Tables 3 through 8, consist of the following:

- Mean concentrations for the calendar year,
- Highest concentrations for shorter time intervals,
- Number of exceedances of air quality standards, and
- Number of samples collected or hours monitored.

In the data summaries, the following abbreviations and footnotes were used:

IV. AIR QUALITY TRENDS

A. CARBON MONOXIDE

From 1989 through 1993 CO concentrations in Phoenix declined gradually at both trend sites, the microscale site, Indian School Road, and Roosevelt Street, the neighborhood scale site (see Figure 4). In 1994 and 1995, however, concentrations increased at these two sites, and then declined in 1996 and 1997. In Tucson, a similar trend is apparent except that concentrations decreased more steeply in 1991-1993. The trend site selected for Tucson, Alvernon Way, is a microscale site. This 10-year trend is also evident in the graph of exceedances of the 8-hour standard, 9 ppm, in Figure 5. Variations from year to year were most likely due to changes in meteorology. However, the 10-year trend suggests a reduction in CO emissions due to cleaner vehicles.

B. LEAD

Lead concentrations during the past 10 years were well below the quarterly standard, 1.5 ug/m³, in both major urban areas (see Figure 5). This is the result of major reductions in lead emissions from vehicles, starting in the mid-1970s due to the use of non-leaded gasoline.

C. NITROGEN DIOXIDE

Concentrations have remained far below the annual standard, 100 ug/m³, in both Phoenix and Tucson in the last ten years. In Phoenix annual averages have been in the 25-50 ug/m³ range and in Tucson, compared with the 30-40 ug/m³ range. Since valid data for Phoenix is limited to recent years at a few sites, a trend graph was not plotted.

D. OZONE

The plot of 1-hour ozone concentrations in Figure 7 does not show any clear, long-term pattern. Thus, it appears that there is not a significant change in the highest 1-hour values for Phoenix, Tucson, and Yuma.

Exceedances of the 1-hour standard, 0.12 ppm, follow a different pattern in Phoenix (see Figure 8). The number of exceedances varied substantially from year to year due to changes in meteorology. This was especially apparent in 1995-1997. Another significant factor affecting the trend data is the expansion of the monitoring network. Maricopa County installed several new sites in the past four years in the eastern part of the Valley where higher ozone concentrations occur.

In Tucson, Yuma, and Pinal County, there were not exceedances of the 1-hour standard monitored.

E. PM₁₀

For the Phoenix metropolitan area, there is not a major variation in PM₁₀ levels apparent over the past six years (see Table 9). There are fluctuations in the annual averages from year to year,

probably due to changes in meteorology or land use near the sites. Chandler remains the only trend site exceeding the annual and 24-hour standards in the area. It should be noted that there are other sites in the Phoenix urban area which exceed the annual and 24-hour standards, but data is limited to a few years. These sites include Phoenix-Maryvale, Phoenix-Greenwood, Phoenix-Salt River, and Higley.

In the Tucson urban area, PM₁₀ concentrations have not changed appreciably in the last six years (see Table 9) with one exception. At the Prince Road site a significant increase in concentrations occurred in 1995. Nevertheless, exceedances of the annual or 24-hour standards have not been monitored in Tucson during the past nine years.

In other areas of Arizona, annual PM₁₀ levels have not varied substantially over the past six years except in Douglas, Naco, Nogales, Payson, and Paul Spur (see Table 10). In Douglas, Nogales, and Payson averages have decreased steadily during this period. Specifically, the annual average in Nogales steadily declined, from 54 ug/m³ in 1992 to 31 ug/m³, in 1997. As a result, Nogales was in compliance with the annual standard in 1993.

Naco and Paul Spur also experienced decreased concentrations. At Naco the PM₁₀ average level declined significantly in 1996 to 32 ug/m³, whereas at Paul Spur, a substantial decrease occurred in 1993. As a result, Paul Spur has achieved and maintained compliance with the annual and 24-hour standards.

F. SULFUR DIOXIDE

In 1989 nine exceedances of the 3-hour standard were monitored in Hayden and San Manuel (see Figure 9). Subsequently, the maximum number of 3-hour exceedances in any of the three Arizona smelter towns has been one per year. Thus, the smelter towns have been in compliance with air quality standards from 1990 through 1997, since one exceedance per year is allowed. The number of 3-hour exceedances is plotted as the trend indicator because this is the most restrictive standard for sulfur dioxide. Miami has the best record among the three smelter towns without exceedances since 1987.
